

ledger — resumable agent state that survives a change of host

The agent's history is disposable; the state that matters is a dated, falsifiable ledger in the repo that any fresh session, on any host or model, can read in two minutes.

Michael Graham repo: [mlgraham/long-horizon-hack-2026](#)
All six gates passed by 11:45 PDT: core, RawTree, second host, Nimble, Liquid, FLUX · 54 tests passing

THE VERBS · ONE SMALL CLI, PLAIN MARKDOWN UNDER `.LEDGER/`

ledger note "..." Appends an entry stamped by the system clock, never by an argument.	ledger gate add / pass / fail Pre-registers a threshold, deadline, owner and kill criterion, then records what was measured.	ledger obligation add Records an unproved claim and whether its hypothesis can be met at all.
ledger pause Writes the <code> </code> entry: what to resume, caps, open rulings, first file to read.	ledger resume Prints the two-minute brief, the only thing a new host needs in context.	ledger watch / tick One loop: fetch the topic, distill a delta, note it, discard the raw page.

Every verb also posts one event: `ts`, `kind`, `host`, `model`, `gate`, `text`, `tokens_in`, `tokens_out`, `bytes_discarded` . No database is needed to run.

THE SPLIT THE BRIEF ASKS FOR

PERSISTS · IN GIT <code>STATUS.md</code> , append-only, clock-stamped <code>gates.md</code> with kill criteria <code>obligations.md</code> <code>pause.md</code> , the latest <code> </code> entry <code>covers/</code> , one image per pause <i>dated, owned, falsifiable</i>	DERIVED · ON DEMAND - the resume brief, rebuilt from files - RawTree "what changed last hour" - the board, rendered from one query - each tick's delta from the last state <i>measured, never remembered</i>	DISCARDED · EVERY TICK - session transcripts - raw pages fetched by Nimble, counted as bytes discarded - the old host's context window <i>history, the thing that rots</i>
--	---	---

FOUR SPONSORS IN THE LOOP · EACH BEHIND A PRE-REGISTERED GATE

SPONSOR	ROLE IN THE LOOP	GATE · PASS BY	NOW
RawTree	Mirrors every event as it is, no schema step. "What changed in the last hour" and the board are two SQL queries a judge can paste.	H2 · 13:30	passed
Nimble	Fetches the watched topic on every tick; only the dated delta is kept.	H4 · 14:30	passed
Liquid AI	Distills raw page plus last state into a delta of three lines at most, on every tick. LFM2.5-1.2B runs locally through Ollama, so the raw page never reaches a frontier model.	H5 · 14:30	passed: 4 KB page → 3 lines in 8–13 s
Black Forest Labs	On <code>pause</code> , a FLUX cover image from the day's digest lands in <code>.ledger/covers/</code> .	H6 · 15:30	passed

The second host is `hosts/claude_code.sh` : a fresh headless Claude Code session whose whole context is `ledger resume` (24 lines in the dry run). It read three files, wrote the summary and left three clock-stamped notes. `hosts/loop.py` offers the same loop on Ollama or the Anthropic API. AWS Bedrock was dropped because no AWS account is available today. A failed gate drops that sponsor from the pitch, never the core.

THE 3-MINUTE DEMO

1 Watch live. <code>ledger watch</code> pulls a real topic through Nimble; the Liquid delta lands in <code>STATUS.md</code> and the raw page's bytes are discarded.	2 Kill mid-task. Stop under Claude Code with the tests failing. Show the <code> </code> pause entry and its FLUX cover.	3 Resume elsewhere. A fresh headless session gets only <code>ledger resume</code> , fixes the code, runs the tests until green and flips the gate with the line it measured.	4 Ask what changed. One SQL query in RawTree returns the last hour of events; the board is rendered from it.
